SKF top mount kit

The essential link between chassis and suspension

SKF top mount kits include suspension bearing, top mount, rubber pad and mounting nuts/bolts if necessary. These high performance components work together to allow comfortable strut rotation while providing effective load capacity and shock absorption.

Kits are available as pre-mounted units or separate components in twin packs or single kits according to repair needs. Our range covers core European and Asian car models on our roads today for both front and rear axles.

Vehicle manufacturers recommend replacing both top mount and bearing at the same time to avoid uneven wear and repeat repairs.

Product features and performance*

- **Top mounts made with high quality rubber with metal inserts:** ensure less vibration and reduced steering effort.
- **Compact and light-weight design:** facilitates installation and reduces friction and noise levels for a comfortable drive.
- **Latest high performance seal design:** includes multiple elastomer seal lips and deflectors prevent pollution ingress for longer bearing life.
- **Specially designed angular contact raceways for robust MacPherson bearings**: increases stiffness allowing a 40% increase in radial load capacity from the spring, increasing stability and reducing noise.
- **Reinforced plastic and fibre glass upper and lower bearing washers:** ensure extra strength, easy mounting and low weight.
- **Greased and sealed bearing:** with high performance grease which resists humidity, vibrations and very low temperatures (-40°C).
- **Integrated robust bearing spring seat:** guides and supports the radial and axial spring loads increasing stiffness and reducing noise levels.
