Matched tapered roller bearings

The SKF assortment of matched tapered roller bearings is based on popular sizes of single row tapered roller bearings in standard or SKF Explorer performance class. Depending on the application requirements, matched tapered roller bearings are available in different designs and variants:

- matched bearings arranged face-to-face
- matched bearings arranged back-to-back
- matched bearings arranged in tandem

The matched bearings listed in the product tables are examples and constitute the basic SKF assortment. Of course, SKF can supply other matched bearings on request. The bearings and ring spacer(s) are delivered as a ready-to-mount set.

Matched single row tapered roller bearings arranged face-to-face

Designs and variants

Matched bearings arranged face-to-face

- have load lines that converge toward the bearing axis (fig. 1)
- can accommodate axial loads in both directions
- can accommodate a limited amount of misalignment
- are supplied as a set with an intermediate ring between the outer rings

Matched bearings arranged back-to-back

- have load lines that diverge toward the bearing axis (fig. 2)
- provide a relatively stiff bearing arrangement
- can accommodate tilting moments
- can accommodate axial loads in both directions
- are supplied as a set with intermediate inner and outer ring spacers

Matched bearings arranged in tandem

- have load lines that are parallel (fig. 3)
- share radial and axial loads equally
- are used when the load carrying capacity of a single bearing is inadequate
- can accommodate axial loads in one direction only. If axial loads act in both directions, a third bearing must be added and adjusted against the tandem pair
- are supplied as a set with intermediate inner and outer ring spacers

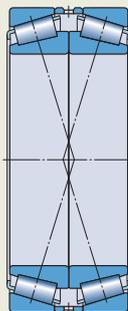

Fig. 2

Matched bearings arranged back-to-back

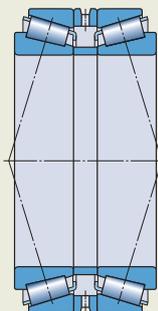

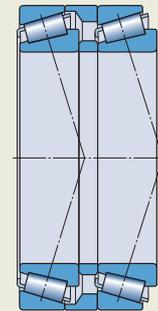

Fig. 3

Matched bearings arranged in tandem

Ring spacer designs

On request, SKF can supply matched bearings with various ring spacer designs. The available designs are listed in tables 1 and 2. Not all designs are available for all bearing arrangements. Contact SKF if you need a special ring spacer design.

Special ring spacer designs are indicated in the bearing designations by the reference numbers, see page 11. The first number denotes the inner ring spacer.

The standard ring spacer designs are:

- for bearings arranged face-to-face → 02
- for bearings arranged back-to-back → 12
- for bearings arranged in tandem → 19

The number for the standard ring spacers is not included in the bearing designation.

Cages

SKF matched tapered roller bearings are fitted with roller centred, stamped steel cages. Contact SKF if your application requires other cages.

General bearing specifications

Dimension standards

The boundary dimensions of the individual bearings used in the matched sets are in accordance with ISO 355.

Tolerances

The individual bearings in SKF matched tapered roller bearings follow Normal tolerances. Bearings in sets with designation suffix CL7C provide tighter run-out tolerances.

The tolerance values for individual bearings are listed in table 3. They conform to ISO 492, except for tolerance

class CL7C. The total width tolerance values of matched sets are listed in table 4.

Tolerance symbols are explained in table 5, page 8.

Tolerance symbols

Tolerance symbol	Definition
Inner ring	
d	Nominal bore diameter
Δd_{mp}	Deviation of a mid-range size (out of two-point sizes) of bore diameter in any cross section from its nominal size
Vd_{mp}	Range of mid-range sizes (out of two-point sizes) of bore diameter obtained from any cross section
ΔB_s	<ol style="list-style-type: none"> 1 Upper limit: Deviation of a minimum circumscribed size of inner ring width, between two opposite lines, in any longitudinal section which includes the inner ring bore axis, from its nominal size 2 Lower limit: Deviation of a two-point size of inner ring width from its nominal size
Kia	Circular radial run-out of inner ring bore surface of assembled bearing with respect to datum, i.e. axis, established from the outer ring outside surface
Outer ring	
D	Nominal outside diameter
ΔD_{mp}	Deviation of a mid-range size (out of two-point sizes) of outside diameter in any cross section from its nominal size
VD_{mp}	Range of mid-range sizes (out of two-point sizes) of outside diameter obtained from any cross section
ΔC_s	<ol style="list-style-type: none"> 1 Upper limit: Deviation of a minimum circumscribed size of outer ring width, between two opposite lines, in any longitudinal section which includes the outer ring outside surface axis, from its nominal size 2 Lower limit: Deviation of a two-point size of outer ring width from its nominal size
Kea	Circular radial run-out of outer ring outside surface of assembled bearing with respect to datum, i.e. axis, established from the inner ring bore surface
Bearing width	
T	Nominal assembled bearing width
ΔT_{sD}	Deviation of minimum circumscribed size of assembled bearing width from its nominal size
T_1	Nominal effective width of cone (inner ring, with roller and cage assembly) assembled with a master cup (outer ring)
T_2	Nominal effective width of cup assembled with a master cone
ΔT_{1s}	Deviation of minimum circumscribed size of effective width (cone assembled with a master cup) from its nominal size
ΔT_{2s}	Deviation of minimum circumscribed size of effective width (cup assembled with a master cone) from its nominal size

Internal clearance

Matched bearings arranged face-to-face or back-to-back

The axial clearance is determined by the spacers inserted between the bearing rings. SKF matched tapered roller bearings are produced as standard with the internal clearance ranges listed in table 6.

Bearing sets with deviating internal clearance are identified by the designation suffix C followed by a number. The number provides the mean value of the

axial internal clearance in μm . The clearance range corresponds to that of the standard clearance.

For example, 32048 X/DFC205 has a mean axial internal clearance before mounting of 205 μm .

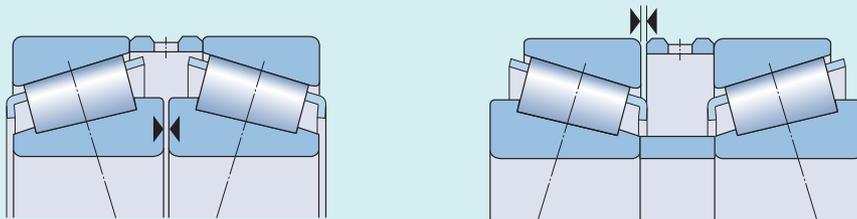

The standard clearance range of a matched set in the 320 series with 240 mm bore diameter is 60 μm (440 to 500 μm). Thus, the clearance range of the set with the designation suffix C205 is 175 to 235 μm .

Matched bearings arranged in tandem

The internal clearance or preload is obtained after mounting, depending on the adjustment against another bearing or bearing set.

Table 6

Axial internal clearance in unmounted condition of matched metric single row tapered roller bearings, arranged face-to-face or back-to-back

Misalignment

The permissible angular misalignment between the inner and outer rings depends on the size and internal design of the bearing, the radial internal clearance in operation and the forces and moments acting on the bearing. Where misalignment cannot be avoided, SKF recommends using a face-to-face arrangement. Any misalignment increases bearing noise and reduces bearing service life.

Permissible speed

The speed ratings in the product tables indicate:

- the reference speed, which enables a quick assessment of the speed capabilities from a thermal frame of reference
- the limiting speed, which is a mechanical limit that should not be exceeded unless the bearing design and the application are adapted for higher speeds

Calculation of bearing load and life

When a radial load is applied to a single row tapered roller bearing, the load is transmitted from one raceway to the other at an angle to the bearing axis and an internal axial load is induced. This should be considered when calculating the equivalent bearing loads for bearing applications consisting of two single bearing arrangements and/or bearing pairs arranged in tandem. SKF provides several engineering programs like [SKF Product select](#) and [SKF SimPro quick](#) that allow a customer to determine the bearing loads and to perform bearing life calculations.

These tools and many more can be found under [Digital tools](#) at [skf.com](#).

Seat tolerances for standard conditions

The standard axial internal clearance of matched bearings arranged face-to-face or back-to-back (table 6) provides an appropriate operating clearance when the bearings are mounted on solid shafts machined to:

- $d \leq 50 \text{ mm}$ → m5[Ⓔ]
- $50 \text{ mm} < d \leq 140 \text{ mm}$ → m6[Ⓔ]
- $140 \text{ mm} < d \leq 200 \text{ mm}$ → n6[Ⓔ]
- $d > 200 \text{ mm}$ → p6[Ⓔ]

SKF recommends these shaft seat tolerance classes for rotating loads on the inner ring where $P \leq 0.06 C$. If tighter fits are selected, be sure that the bearings are not preloaded and are able to rotate freely. The reduction of internal clearances caused by axial locating forces should also be taken into consideration.

For stationary outer ring loads, SKF recommends housing bore tolerance classes J6[Ⓔ] or H7[Ⓔ].

Mounting

Sets of matched tapered roller bearings must be mounted without any axial space between the spacers and the inner and outer rings. During mounting, turn the shaft through several revolutions in both directions to make sure there is proper contact between the roller ends and guide flanges. If there is no proper contact, the resulting clearance or preload will be incorrect, which can lead to premature bearing failure.

Designation system

Examples:	31318 X/L4BDFC210	31318	X /	L4B	DF	C210
	31309/CL7CDFG40	31309	/		CL7C	DF G40
	32022T84 X/DB11C700	32022	T84 X /			DB11 C700

Basic designation

The first digit identifies the bearing type (3 = tapered roller bearing).
 The following two digits identify the ISO dimension series.
 The last two digits of the basic designation identify the size code of the bearing bore.
 The size code multiplied by 5 gives the bore diameter (d) in mm.

External design

T... A number immediately following the T identifies the total width of matched bearings, arranged back-to-back or in tandem.
X Boundary dimensions changed to conform to ISO

Materials, heat treatment

HA1 Inner and outer ring case hardened
HN3 Inner ring with special surface heat treatment
HN4 Bearing rings and rollers with special surface heat treatment
L4B Bearing rings and rollers with special surface coating

Accuracy

CL7A Pinion bearing
CL7C High-performance design

Bearing sets, matched bearings

DB.. Two bearings matched in back-to-back arrangement. A two-digit number immediately following the DB identifies the design of the inner and outer ring spacers (see *Ring spacer designs*, page 5).
DF.. Two bearings matched in face-to-face arrangement. A number immediately following the DF identifies the design of the inner and outer ring spacer (see *Ring spacer designs*, page 5).
DT.. Two bearings matched for mounting in tandem. A number immediately following the DT identifies the design of the inner and outer ring spacers (see *Ring spacer designs*, page 5).
C... Special clearance. The number immediately following the C is the mean axial internal clearance in μm . The range remains the same as specified in table 6, page 9.
G... Special preload. The number immediately following the G is the mean axial preload in μm .

Other variants

V004 CL7C + C15 + special clearance range
VS118 Reduced axial clearance or preload range

SKF Explorer bearings

SKF Explorer bearings have optimized internal designs and surfaces that typically reduce friction and heat generation, provide high wear resistance, and allow heavier loads to be accommodated.

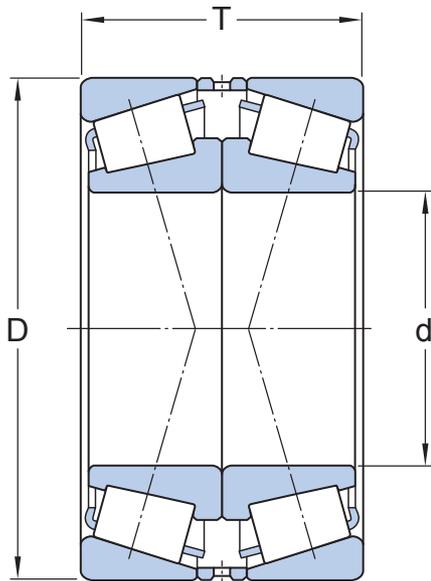

The optimized bearing features vary across the product range but in an application, SKF Explorer bearings can:

- Contribute to extended service life
- Increase uptime and productivity
- Reduce maintenance needs
- Reduce noise and vibration
- Enable downsizing of the application
- Contribute to a more sustainable solution

By using SKF's bearing selection process you will be sure to get the most out of your bearing arrangement.

SKF Explorer bearings are shown coloured blue in the product tables on pages 12–20.
